

Claim 2

I claim that AIMS comprises my state-of-art intelligent Computer-Manage-Computer (CMC) automation technology, which has never been published in the public arena.

Abstract of the disclosure

AIMS is design to eventually have computer provide management function to manage other computers (CMC). The process management algorithms is proven to work on higher level of intelligence as long as the business rule can be represented in the digital logic. This will be relief of management on monitoring various indexes in order to make business decision. By the modularized design, the CMC automation can be operated either an integrated part of AIMS or an independent system outside AIMS.
